

Website Traffic Analysis — Short Report

Prepared for Alfido Tech | Intern Spark Data Analyst Project

Dataset: Kaggle — Website Traffic Analysis (226,278 events, 3,839 landing pages, Aug 19-25, 2021)

226,278 Total Events	142,015 Pageviews	39.2% Click-Through Rate	20.1% Preview Rate	3,839 Landing Pages
--------------------------------	-----------------------------	------------------------------------	------------------------------	-------------------------------

A Note on This Dataset

This dataset is a **music smart-link (landing page) event log**, not a classic session-based website log — there is no session ID, visitor ID, referrer/UTM field, or time-of-day timestamp. As a result, **sessions, unique users, average session duration, classic bounce rate, and referral source cannot be computed** from this data. This report uses the closest honest adapted metrics instead: each landing page's on-page funnel (Pageview → Click → Preview) stands in for a user journey, and click-through rate stands in for a conversion signal. See the companion notebook for full detail and methodology.

Key Insights

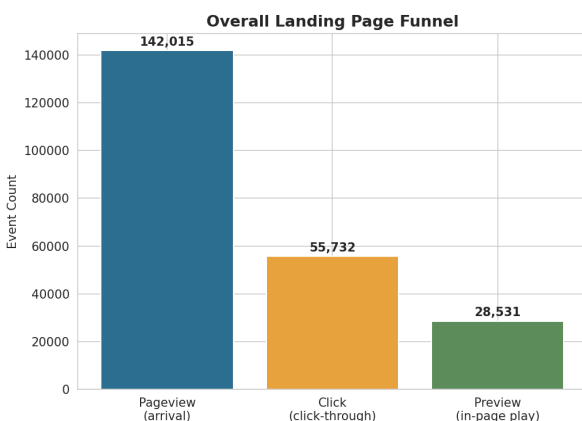

Figure 1. Overall funnel: Pageview -> Click -> Preview.

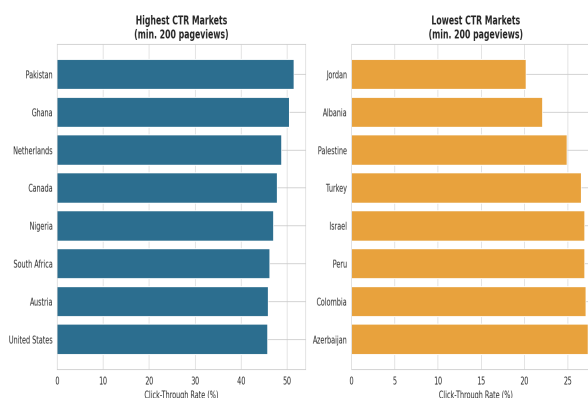

Figure 2. Highest vs. lowest CTR markets (min. 200 pageviews).

- **~39.2% click-through rate, ~20.1% preview rate** — a combined engagement rate of ~59.3%, meaning roughly 41% of pageviews show no recorded follow-on action.
- **One track ("Jalebi Baby" by Teshar) drives ~18% of all traffic** on its own — traffic is heavily concentrated among a handful of top pages, with a long tail of ~3,800 lower-volume pages.
- **Traffic volume and conversion quality diverge by market.** Pakistan (51.5%), Ghana (50.5%) and the Netherlands (48.8%) convert far above the 39.2% average despite modest traffic; Jordan (20.2%), Albania (22.1%) and Palestine (24.9%) convert well below it.
- **Saudi Arabia, India, and the US are the top three markets by volume**, together over half of all traffic — Jeddah and Riyadh alone outdraw most entire countries in the dataset.
- **Traffic declined gradually across the observed week** (Aug 19-25, 2021) with no confirmable weekly cycle in just 7 days of data.

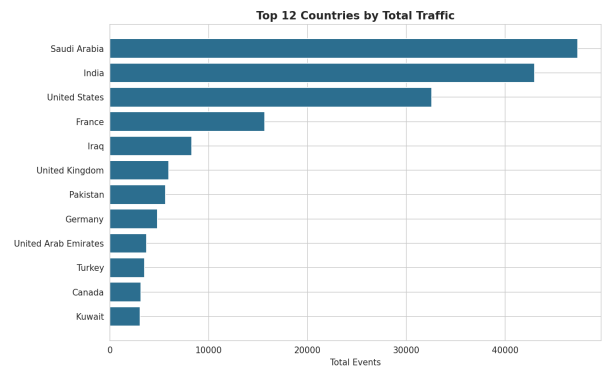

Figure 4. Top 12 countries by total traffic.

Action Items to Improve Conversions

1. Replicate what top-CTR pages do right

Audit landing pages with CTR well above the 39.2% average for shared design/content patterns (CTAs, preview placement, artwork) and apply those patterns more broadly.

2. Grow traffic in high-CTR, lower-volume markets

Pakistan, Ghana, and the Netherlands already convert very well — targeted promotion here likely has a better payoff than acquiring more traffic in already-saturated top markets.

3. Diagnose low-CTR markets before spending more there

Jordan, Albania, and Palestine convert roughly half the site average — investigate language, payment/streaming availability, or cultural fit before increasing spend in these markets.

4. Make the in-page preview more prominent

Only ~20% of pageviews result in a preview play. A more prominent or auto-suggested preview could recover part of the ~41% of visits with no recorded action at all.

5. Instrument session/visitor/referrer tracking going forward

Adding a session ID, visitor ID, time-of-day timestamp, and referrer/UTM field would unlock true users, session duration, bounce rate, and channel attribution — none of which are reconstructable from this data today.
